

## DOCTORAL STUDIES COURSE UNIT DESCRIPTION

Name of subject	Scientific Field	Faculty	Center/Institute/Department
<b>Astrospectroscopy</b> (8 ECTS credits)	Physics N 002	Faculty of Physics	Institute of Theoretical Physics and Astronomy, Astronomical Observatory
Student's workload	Hours	Student's workload	Hours
Lectures		Consultations	
Individual study	160	Seminars	40

<b>Course annotation</b>			
Diversity of modern astrospectroscopy methods. Spectral properties of astrophysical objects at different wavelenght ranges. Stellar spectroscopy: spectra of normal stars and their analysis; spectra of peculiar stars and their analysis; influence of non-stationar phenomena on spectral line formation. Particularities of stellar parameter determinations: atmospheric parameters; abundances of chemical elements; elemental isotope ratios; measurements of radionuclides. Spectroscopy of stellar populations. Integral spectra of stellar populations: globular stellar clusters; galaxies; active galaxies and quasars. Spectroscopic methods for determining of stellar population characteristis: age, metallicity, kinematic parameters. Practical possibilities of modern astrospectroscopy. Software packages for spectral reductions, for chemical composition studies using spectral line equivalent widths; for spectrum syntheses. Specific software packages for spectral analyses. Archives of stellar spectra, services of virtual observatories, standartization questions. Databases of input parameters for stellar spectra analyses.
